

ABSTRACT

1

2

3 A window for gating light for the purpose of controlling temperature within a
4 building, comprising a light transmissive substrate, a plurality of at least partially
5 reflective rollout members disposed on said substrate, the rollout members being
6 responsive to a source of electrical potential to cause the rollout members to rollout,
7 and an electrically conductive at least partially light transmissive conductive
8 member disposed in facing relationship with said reflective rollout members and
9 said substrate.
